	Urgent	**Not Urgent**
Important	**Do - (Your MVP)** ● Order electrical parts (4 servos, barrel jack & adapter, servo wires) ● CAD the arm and 3D print it through Bechtel ● Python script to send controller inputs to Arduino ● Arduino script to parse controller inputs and power servos	**Schedule - (For V2.0+)** ● Design inverse kinematic solver for this arm so that controller can control end effector position instead of joint angles ● Add speed safety interlocks to prevent voltage spikes
Not Important	**Delegate - (Use a library)** ● Encode and decode byte data running from computer to USB-C myself ● Decode byte data from bluetooth connection to gamepad	**Delete - (Cut it)** ● Upgrade microcontroller from Arduino R4 to ESP32 (this way the microcontroller can directly connect to gamepad) ● Add current sensing for the gripper to detect when gripping an object
